

Does your SAP Work Manager have issues?

Get a free Health-check and get on the path to stability and success

Does your server crash regularly or require frequent restarts?

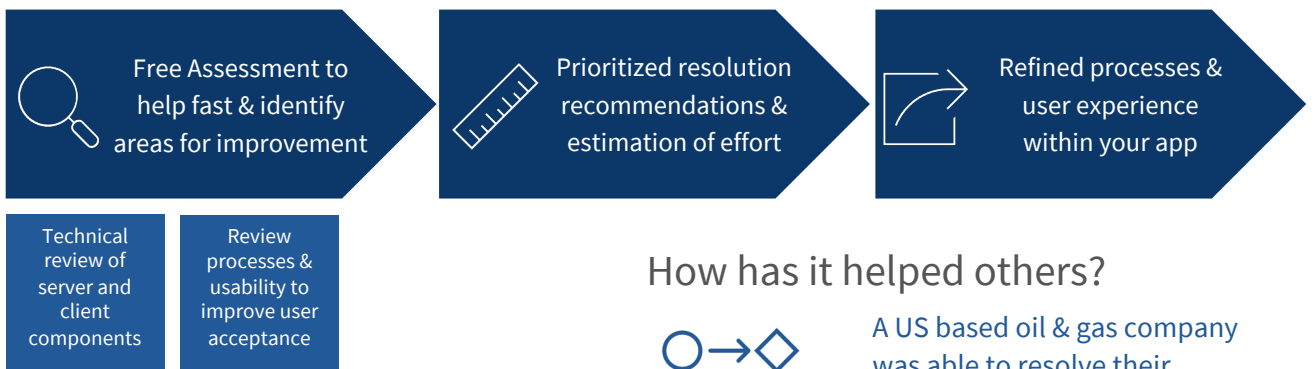

Is your sync painfully slow? Does it time out? Are you all too familiar with Error 13?

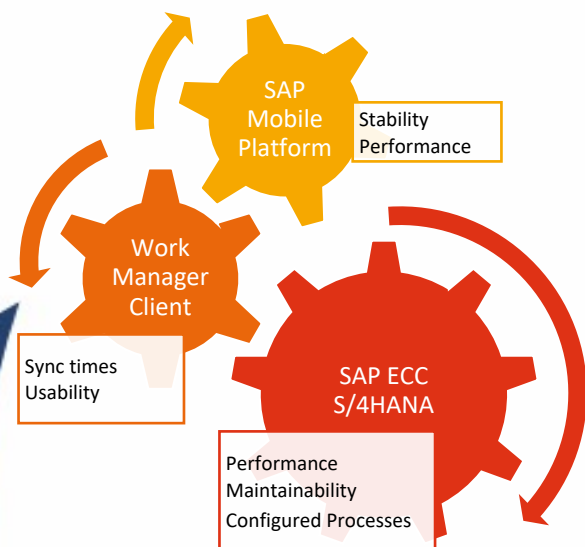

Are your users frustrated with too many clicks? Do they get lost navigating or miss data entry fields?

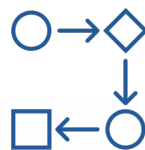

We at Evora recognize there is a big difference between implementing a solution that “technically works” and a solution that meets the needs of the business. Your SAP mobility solution components must work together functionally and technically to get the most value from your investment. If you have issues with your SAP Work Manager, it might be time for an assessment with our hands-on team. If you give us an hour of your time, we will give you our insights based on real experience and a clearly defined path to get your system performing the way it should. You may be surprised what we can accomplish in just one hour.

What components get reviewed?

How has it helped others?

A US based oil & gas company was able to resolve their synchronization issues and improve screen flow which improved user adoption and increased data quality.

25+

After the health check and usability improvements a global chemical company rolled out their Work Manager to all subsidiaries in over 25 countries.

A major US university was able to solve their server crashing & client sync issues as well as increase user satisfaction by improving the client usability.
